E-COMMERCE CUSTOMER & SALES INTELLIGENCE DASHBOARD
INSIGHTS & RECOMMENDATIONS
OLIST BRAZILIAN E-COMMERCE DATASET (2016–2018) | GROUP 3

KEY INSIGHTS

1. Health & Beauty is carrying the business

Health & Beauty isn't just the top category, it's outperforming everything else by a wide margin. Automotive and Toys bring in some revenue too, but nowhere close, and most of the remaining categories barely register. That's a warning sign as much as a win: if demand in Health & Beauty ever cools off, a huge chunk of Olist's revenue goes with it.

2. Most customers are buying small

Across 98.67 thousand orders and R$13.59 million in revenue, the average order comes out to about R$120.65. In other words, people are mostly buying one or two things at a time, not filling up a cart. That's actually good news, it means there's real room to grow revenue just by getting people to buy more per visit.

3. A handful of states are doing most of the work

Sales are heavily concentrated in a small number of Brazilian states, while the rest contribute comparatively little. Olist clearly has a strong foothold in certain regions, but that also means there's a lot of untapped potential everywhere else.

4. Customers are happy overall, but it depends where they live

The average review score sits at 4.09 out of 5, which is solid. But once you line reviews up against delivery times, a pattern shows up: states with slower deliveries tend to have noticeably lower ratings. Delivery speed is clearly shaping how customers feel about the whole experience.

5. The delivery performance numbers look off

The delivery performance breakdown comes out to an exact 33.33% each for On Time, Late, and In Transit/Pending. That's suspiciously tidy a real-world split almost never lands that evenly. It's likely this field was built with placeholder or incomplete logic, so any insights drawn from it should be treated as provisional until it's checked.

RECOMMENDATIONS

1. Diversify beyond Health & Beauty

Given how dominant Health & Beauty is, it's worth pushing other strong categories, like Relógios Presentes and Cama, Mesa & Banho through targeted marketing and seller incentives. A more even revenue mix means less exposure if one category slows down.

2. Get people to spend more per order

At R$120.65 average order value, there's clear upside in encouraging bigger baskets think product bundles, "frequently bought together" suggestions, or free-shipping thresholds. This is a way to grow revenue without spending more to acquire new customers.

3. Push into the states that are underperforming
Since sales are so concentrated, expanding into lower-performing regions is low-hanging fruit. Bringing in more local sellers and strengthening logistics coverage there could open up meaningful new revenue.

4. Fix delivery where it's hurting satisfaction
Regions with both slow deliveries and low ratings should be the priority for logistics improvements. Tightening up delivery partnerships in these areas should lift both satisfaction and repeat purchases.

5. Double-check the delivery performance metric before relying on it
Before this number goes into any final reporting, the team should verify exactly how the delivery performance field is calculated. Getting that confirmed will make sure the dashboard's conclusions actually hold up.
